Hybrid Occupancy Research Summary

What 14 months of badge, Wi-Fi and sensor data say about how offices are really used

Between August 2025 and September 2026, six members shared anonymised occupancy data from 11 buildings in Bengaluru, Mumbai, Hyderabad and the NCR. The data cover about 18,000 employees. This summary highlights the patterns that matter for space and service planning.

1. Weekly pattern

Day	Average occupancy	Share of weekly visits
Monday	49%	17%
Tuesday	66%	23%
Wednesday	69%	24%
Thursday	58%	20%
Friday	28%	10%
Saturday and Sunday	3%	1%

2. Findings

- Mid-week peaks are persistent: Tuesday and Wednesday run 35 to 40 points above Friday
- Teams that agreed anchor days produced the highest satisfaction and the lowest idle space
- Seat sharing above a 0.7 ratio produced booking friction unless meeting rooms were added
- Visitors and contractors add 6 to 9% to peak load and are almost never in capacity models

3. Implications for facilities

1. Schedule heavy cleaning, plant maintenance and fit-out noise on Mondays and Fridays.
2. Run HVAC on a sliding schedule linked to the booking calendar rather than a fixed time.
3. Adjust cafeteria production using next-day bookings to cut food waste by 12 to 18%.
4. Review lift and parking capacity at the Wednesday peak, not the average day.

4. Limits of the data

Badge data counts entries, not time on desk; Wi-Fi counts devices, not people. The sample excludes manufacturing and retail sites. Use the numbers to frame a pilot and verify them with your own sensors.
